Peer feedback in Higher Science Education

In science research, review between peers (colleagues in the same area of interest) is commonly used to check papers that will be published in science journals. In higher education this is called peer feedback in which students assess each other’s reports or presentations. In this research we looked at how many lecturers actually use peer feedback in their education, what the quality is of peer feedback, how serious students handle peer feedback, what they actually do with the received peer feedback and if there is any effect on their study success and behavior.
